

**Make sure you set up these two DNS records at your domain provider e.g. Hostinger**

### A Record

- Type: A
- Name: @
- **Value:** 64.176.65.141 (your server IP)
- TTL: 300 or Default

### CNAME Record

- Type: CNAME
- Name: www
- **Value:** gptsweetheart.com (your domain name without www)
- TTL: 300 or Default

### Explanation:

When someone types your domain name (like gptsweetheart.com) into their browser, the internet needs to know **where your server is** so it can show your website.

- **The A record** is like the home address for your domain — it points directly to your server's IP address so browsers know exactly where to go.
- **The CNAME record** for www is just a shortcut. It tells browsers that www.gptsweetheart.com should go to the same place as gptsweetheart.com, so both addresses work.

Without these DNS records, your domain name wouldn't be connected to your server, and nobody could access your site.
