

The prompts I used at Lovable for the frontend redesign

Prompt 1:

I already created a fully working SaaS including a frontend based on static html pages with suitable separate java script pages.

My goal now is to recreate the frontend I already have but with a even better and more modern design.

It's very important, that you don't change the functionality of the already existing and working front end pages. DO NOT add new values or parameters and also DO NOT take away the ones that already exist. The goal is to just create a differently looking front end that works exactly the same way the original one does. It just looks different.

In the first step I will show you index.html, dashboard.html, dashboard.js, site.js and site.css.

Take your time to really understand your task and the provided inputs and then only give me the following back:

- index.html
- dashboard.html
- site.css

Make sure that these pages still function the exact same ways as before but that they have a fresh super modern looking design. Use the same dark/pink colors as before but just give it a more professional and polished look, typical for a 2025 SaaS platform in the AI space. Keep in mind that after you are done with task one I will also provide you the other pages of the SaaS that also need the same look.

Take as much time as you need and work very precisely. Think step by step.

Prompt 2:

I want you to also apply the same new design now also to all other pages I provide here. As before don't change anything regarding the functionality, just change the pages so they have also the new modern design like the dashboard and index that you already adjusted. Give me back the adjusted html codes that I provided. Take as much time as you need.
